

IMAGE AND DATA PROCESSING SYSTEM

ABSTRACT

A system and method for processing financial information is provided. A client request may be received through an application program interface (API). A first set of data based on the client request may be retrieved through the API from a first information repository comprising information on debit transactions and credit transactions. The first set of results may be transmitted to the client application for display. A second client request based on the first set of results may be received through the API from the client application, and a second set of data may be retrieved through the API from a second information repository comprising information on credit transactions and component deposit items. The second set of results may be transmitted back to the client application for display. A third client request based on the second set of results may be received, and corresponding financial image information may be retrieved from an image information repository and transmitted back to the client application for display.
